

Heavy Metal Concentration Report

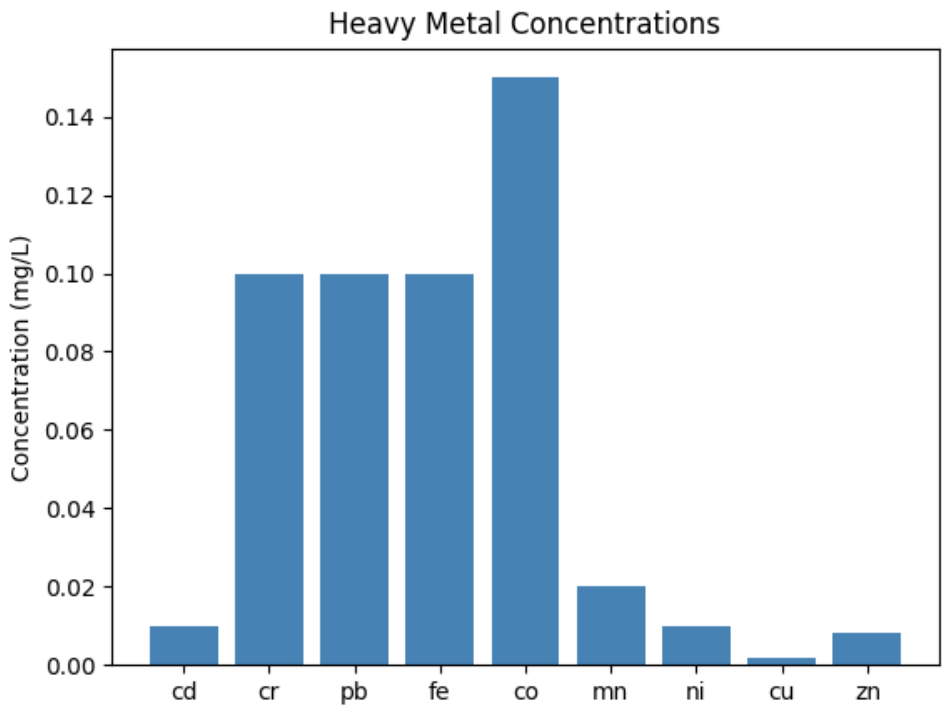

Sample Collection Summary

Latitude: 22.48
Longitude: 25.21
Source: Lake

Indices Summary

Contamination Degree (Cd): 2.409
Health Exposure Index (HEI): 11.409
Heavy Metal Pollution Index (HMPI): 268.349
*All the formulae and definations have been described in the generated report card.

Heavy Metal Concentrations

Heatmap Analysis

- Implement advanced water treatment technologies such as reverse osmosis, ion exchange, or activated alumina filtration, which are effective in removing heavy metals, at the point of entry or point of use.
- Issue public health advisories and provide alternative safe drinking water sources immediately, especially for vulnerable populations like pregnant women and children, until the water quality meets safety standards.
- Establish a robust long-term monitoring program for all heavy metals, ensuring regular testing and compliance with national and international drinking water guidelines.
- Investigate the potential for biomagnification and bioaccumulation of these heavy metals in the local ecosystem and food chain, as this could pose additional health risks to the population.
